JASMINE TRUONG

415.912.8232 | jas.truongg@gmail.com | San Francisco, CA | linkedin.com/in/jas-truong | github.com/jtruong97

Full-Stack Software Engineer with 2+ years building production web applications in TypeScript, React, Node.js, and PHP for an AI-driven platform. Experienced in end-to-end feature ownership, REST API integration, relational data modeling, geospatial visualization, and resilient third-party data pipelines. Promoted to Software Engineer II within 20 months.

TECHNICAL SKILLS

Languages & Front-End: TypeScript, JavaScript (ES6+), Python, PHP, SQL, HTML5, CSS3, React, React Native, Redux, TanStack Query, Expo, Tailwind CSS, Mapbox GL, i18n/l10n

Backend & Data: Node.js, Express.js, CodeIgniter (MVC), REST APIs, GraphQL, PostgreSQL, MySQL, Data Modeling, Query Optimization, JWT, OAuth 2.0

Cloud & DevOps: AWS (EC2, S3), Docker, Supabase, Cloudflare, CI/CD Pipelines, Git

Testing & Practices: Jest, Unit Testing, Code Review, ESLint, Agile/Scrum, System Design

WORK EXPERIENCE

Software Engineer II | *Rhombus Power Inc · Palo Alto, CA* May 2026 – Present

Full-stack engineer building AI-driven, geospatial applications within Ambient, a platform supporting national security operations.

- Partner with data engineering to cut map load time from 60s to under 1s on a high-volume time-series geospatial dataset, rewriting application queries to leverage new date partitioning and language filtering.
- Ship roughly one production feature per month, each spanning frontend and backend from design through QA and deployment — rotating across three concurrent codebases and two stacks (React/Node.js and PHP/CodeIgniter).
- Build layered geospatial interfaces with Mapbox GL — GeoJSON overlays and polygon rendering atop raster imagery, with date-range selectors that filter multiple independent layers in sync.
- Implement environment-driven feature configuration so one codebase ships per-client feature sets, gating functionality across deployments without forking.
- Contribute to system design discussions, translating ambiguous client requirements into implementable designs and data models.
- Mentor junior developers through code review and technical guidance; onboarded a new team member onto the codebase and release workflow.
- Maintain 85% Jest function coverage per file and remediate all critical and severe SonarQube findings before release; coordinate tagged release deployments with DevOps.

Software Engineer I | *Rhombus Power Inc · Palo Alto, CA* Sep 2024 – May 2026

- Built interactive geospatial visualizations with Mapbox GL, integrating raster imagery and GeoJSON data via REST APIs into production mapping applications.
- Implemented internationalization (i18n) for non-Latin scripts, delivering reusable localization infrastructure in 2-week Agile sprints.
- Delivered assigned components of larger full-stack features against established specs, shipping responsive, cross-browser UI in React and CodeIgniter (MVC); debugged services in Docker and deployed to AWS (EC2, S3).

PROJECTS

FullyBookd fully-bookd.com

Reading tracker built around unreleased books — series status, release calendars, and private-by-default shelves (OAuth 2.0 / JWT, row-level security). Built solo; catalog grown 13,000 → ~14,900 titles.

- Built scheduled serverless pipelines (Supabase Edge Functions) that discover new titles from followed authors and backfill missing metadata, using bounded batches, oldest-first queue rotation, and a rate-limit circuit breaker so runs resume where they left off.
- Reconciled metadata across three external APIs (Hardcover, Google Books, Open Library) with per-field fallback, validating candidate publication dates against an independently-sourced anchor year and rejecting mismatches rather than taking last-write; a 0–100 quality score sets refresh cadence.
- Designed local-first search that queries the Postgres catalog via a fuzzy-match RPC before falling back to external APIs, with coverage-weighted relevance ranking and series-sibling awareness so a series name surfaces its sequels; debounced, TTL-cached, and guarded against stale responses.
- Automated catalog deduplication in PL/pgSQL — normalized title/author matching across punctuation and edition markers — run via pg_cron with per-step row counts logged and dry-run queries gating destructive merges.

EDUCATION

Certificate, Full-Stack Software Engineering App Academy — 2024

B.S., Molecular, Cell, and Developmental Biology University of California, Santa Cruz — 2016

ADDITIONAL EXPERIENCE

Medical Assistant | *AC Wellness Medical Group · Cupertino, CA* Jan 2022 – Jan 2024

Clinical patient care and daily EHR systems use prior to transitioning into software engineering.
